

## The Link between the Plutonic and Volcanic Silicic Magmatism

The April, 2016 issue of the Journal *Elements* is devoted to the theme of the “Enigmatic Relationship between Silicic Volcanic and Plutonic Rocks “ and therefore of great interest to all those interested in the study of granitic rocks, their extrusive equivalents and *inter alia* the origin of the predominantly silicic crust of the Earth. New evidences from Petrology, Geochemistry, Geophysics and Experimental Studies are adduced in the six learned articles to arrive at a better understanding of the plutonic-volcanic connection in silicic magmatism.
